The fast-growing sugarcane plant is a major source of sugar (sucrose) in tropical and sub-tropical regions. The high productivity of the plant also makes it a key target for use as an energy crop. The fiber of the plant is used to generate electricity and produce ethanol as a fuel. Sugarcane is a hybrid of two species, each of which is genetically complex. The high level of genetic complexity ...

Backcross Breeding: A breeding method used to move one or a few desirable genes from an agronomically poor line to an elite line. This is done by crossing the line having a few desirable genes (donor parent line) to an elite line (recurrent parent line), and crossing offspring with the desired gene(s) to the recurrent parent. For more information, see the Backcross Breeding article.
