Abstract. The usefulness of diagnostic tests, that is their ability to detect a person with disease or exclude a person without disease, is usually described by terms such as sensitivity, specificity, positive predictive value and negative predictive value. In this article, the first of the series, a simple, practical explanation of these concepts is provided and their use and misuse discussed.

Understanding Diagnostic Tests 1: Sensitivity, Specificity ...
The sensitivity and specificity of a test vary according to the level that is chosen as the cut-off point. The receiver operating characteristic (ROC) curve, a graphical technique for describing and comparing the accuracy of diagnostic tests, is obtained by plotting the sensitivity of a test on the y axis against 1-specificity on the x axis. Two methods commonly used to establish the optimal cut-off point include the point on the ROC curve closest to (0, 1) and the Youden index.

Understanding diagnostic tests 3: receiver operating ...

The whole purpose of a diagnostic test is to use its results to make a diagnosis, so we need to know the probability that the test result will give the correct diagnosis . Positive and NPVs describe a patient's probability of having disease once the results of his or her tests are known. Positive predictive value

Understanding diagnostic tests 1: sensitivity, specificity ...

The results of many clinical tests are quantitative and are provided on a continuous scale. To help decide the presence or absence of disease, a cut-off point for 'normal' or 'abnormal' is chosen. The sensitivity and specificity of a test vary according to the level that is chosen as the cut-off point. The receiver operating characteristic (ROC) curve, a graphical technique for describing and comparing the accuracy of diagnostic tests, is obtained by plotting the sensitivity of a test on the ...

Introduction. In two previous articles in this series, [1], [2] we discussed some of the properties of diagnostic tests. The sensitivity and specificity of a test inform us about the likelihood of a positive or a negative result, given that the disease of interest is present or absent, whereas positive and negative predictive values tell us about the probability of presence or absence of the disease, given that a test's result is positive or negative.
